Mr. Ryan Benefield
Chief of Hazardous Waste Division
Arkansas Department of Environmental Quality
5301 Northshore Drive
North Little Rock, AR 72118-5317

Subject: **Wormald Site Investigation Report**
Tyco Safety Products – Former Cedar Chemical Facility
Helena – West Helena, Arkansas
State EPA ID No. ARD990660649

Dear Mr. Benefield:

On behalf of Tyco Safety Products – Ansul Incorporated, AECOM is pleased to submit two copies of this *Wormald Site Investigation Report* that summarizes the subsurface soil sampling activities and analytical results for soil samples collected from Site 3- Stormwater Ditches at the Former Cedar Chemicals Facility located in Helena – West Helena, Arkansas (Figure 1). The Wormald Site Investigation was conducted in accordance with the *Wormald Site Investigation Work Plan* dated January 22, 2009, the subsequent Arkansas Department of Environmental Quality approval letter dated January 29, 2009, and the *Wormald Separate Agreement Pursuant to Consent Administrative Order LIS No. 07-027 for the Conduct of a Site Investigation and Feasibility Study* (Wormald Separate Agreement) between the Arkansas Department of Environmental Quality (ADEQ), and Ansul Incorporated, Wormald U.S., Inc dated January 9, 2009. A summary of field activities, soil sampling procedures, and analytical results is provided below.

Investigation Objectives

During the 1996 Facility Investigation, dinoseb was reported at a concentration of 13,000 milligrams per kilogram (mg/kg) in subsurface soil sample 3SB-6 (4 to 8 feet below ground surface (bgs)) and identified as a contaminant of concern (COC) for Site 3 in the Risk Assessment (EnSafe, 1996; ADEQ, 2005). The Wormald Site Investigation focused on the collection of additional subsurface soil samples at Site 3 to confirm the concentration of dinoseb in subsurface soil at historic sample location 3SB-6 and to evaluate possible dinoseb concentrations in the vicinity of 3SB-6.

Site Reconnaissance

Prior to implementing field work, soil boring locations were surveyed and staked by Smith and Weiland Surveyors, an Arkansas licensed land surveyor. Utility clearance for all environmental sample locations was provided by Arkansas One-Call prior to intrusive work. Site surveying and utility clearance activities were conducted on March 4, 2009 and were overseen by the AECOM Project Geologist/Field Manager.

Borehole Installation, Lithologic Sampling and Headspace Screening

On March 5, 2009, five soil borings (TSB-1 through TSB-5) were installed within Site 3 for the collection of soil samples for dinoseb analysis (Figure 2). The additional analytical data were needed to confirm the reported concentration of dinoseb (13,000 mg/kg) at historical sample location 3SB-6 (EnSafe, 1996)) and to assess the occurrence of dinoseb concentrations in the subsurface.

Soil borings were installed by Tri-State Testing Services, Inc., located in Memphis, Tennessee, using a Direct Push Technology (DPT) Geoprobe® rig. Continuous soil samples were collected from each soil boring and were logged for lithology by an AECOM Geologist. Lithologic classification was conducted in accordance with the Unified Soil Classification System (USCS) and soil descriptions were recorded on Test Boring Reports (Appendix A). A Photo Ionization Detector (PID) Organic Vapor Analyzer (OVA) was used to assess the qualitative concentration of potential volatile organic vapors present in vadose zone soil core samples. PID headspace results were recorded on Test Boring Reports (Appendix A).

Soil Sampling Program

Five soil borings, designated TSB-1 through TSB-5 (Figure 2), were installed at Site 3 to confirm and/or assess the occurrence of dinoseb concentrations in subsurface soil at historic soil sample location 3SB-6, collected from 4-8 feet bgs in lithologic boring LB-6 during the 1996 *Facility Investigation* (EnSafe). One primary soil sample was collected from 4-8 feet bgs at each boring for analysis of dinoseb. Two additional soil samples, one from 1-4 feet bgs and one from 8-12 feet bgs, were collected from TSB-1 and held for analysis pending dinoseb results from the 4-8 foot interval.

Soil was collected from the desired sample interval at each boring using DPT Geoprobe® rig with disposable acetate sample sleeves lining the core barrel. Soil samples were collected from the acetate sleeve using a decontaminated stainless steel spoon, were placed new, disposable zip-lock bags, and were thoroughly homogenized in the bags prior to containerization. A portion of the sample was later screened for organic vapors utilizing a PID OVA. Soil samples for laboratory analysis were containerized in laboratory supplied bottleware and placed in an ice filled cooler pending delivery to the laboratory.

Soil samples were analyzed for dinoseb by Environmental Testing and Consulting, Inc., located in Memphis, Tennessee, using Environmental Protection Agency (EPA) SW846 Method 8151A. Environmental Testing and Consulting, Inc. has been certified under the ADEQ Laboratory Certification Program and a copy of the certification is provided in Appendix B.

QA/QC Program

The quality assurance/quality control (QA/QC) program was implemented to provide a system of documented checks that ensures the authenticity and validity of the environmental data. QA/QC samples, including one field duplicate (soil) sample, one equipment rinsate blank sample, and one matrix spike/matrix spike duplicate (MS/MSD) sample, were collected and analyzed for dinoseb by EPA SW-846 Method 8151A. Results from the QA/QC samples were used during the data validation process as discussed in Data Validation Report (DVR) in Appendix C.

Analytical Test Results

Table 1 summarizes the results for dinoseb in subsurface soil samples collected from the 4 to 8 foot depth interval at Site 3. Dinoseb was reported in all samples at concentrations ranging from 10.6 milligrams per kilogram (mg/kg) in TSB-4 to 44.2 mg/kg at TSB-1. All results were significantly below the EPA Region 6 Medium-Specific Screening Level (MSL; 680 mg/kg) for dinoseb in subsurface soil. Soil samples from the 1 to 4 foot and 8 to 12 foot interval at TSB-1 were prepped and held pending the analysis of the 4 to 8 foot sample but were not analyzed since the concentration of dinoseb at TSB-1 (4 to 8 foot) was less than the EPA Region 6 MSL and required no further delineation.

Three soil samples (TSB-3, TSB-4, and TSB-5) were qualified by the laboratory with a "J", indicating they are estimated values between the method detection limit (MDL) and the reporting limit (RL). The relative percent difference between the primary sample (TSB-1) and the field duplicate sample (TSB-1-a) was not calculated since the value reported for the field duplicate sample was qualified as an estimated value ("J" flagged). Results of the data validation indicate the data associated with this laboratory batch should be considered compliant and adequate for its intended use. The Data Validation Report is provided in Appendix C along with the Chain of Custody forms and analytical laboratory Certificate of Analysis.

Solid IDW Characterization and Management

All sampling equipment was pre-cleaned and wrapped in plastic prior to mobilization; therefore, on-Site equipment decontamination was not necessary. Used PPE, disposable sampling equipment, and other miscellaneous trash was consolidated in trash bags at the end of each day and sealed for subsequent off-Site disposal.

Soil generated during soil sampling activities was contained in a new 55-gallon drum approved by the Department of Transportation (DOT) and staged at a central location in accordance with all Federal, State and local requirements. The drum was labeled to indicate the type of material contained, place of origin, Site number and location, boring numbers, and date on which materials were initially placed in the container. An Investigation Derived Waste (IDW) Management Form was completed to document IDW generated during field activities and is include in Appendix A.

At the completion of field activities, a representative sample of solid IDW was collected for analysis of toxicity characteristic leaching procedure (TCLP) volatile organic compounds (VOCs) by EPA SW-846 Method 8260B, TCLP semi-volatile organic compounds (SVOCs) by EPA SW-846 Method 8270C, TCLP pesticides by EPA SW-846 Method 8081A, TCLP herbicides by EPA SW-846 8151A, and TCLP metals by EPA SW-846 Methods 6010B/7470A to evaluate disposal options. The TCLP results are presented in Table 2 and Certificates of Analysis are presented in Appendix C. The IDW soil sample results were below the Hazardous Waste Characterization Thresholds for all constituents analyzed. The drum of IDW soil is currently staged on Site pending the selection and scheduling of an IDW disposal contractor. Once the disposal contractor has been procured, the drum of soil will be disposed of in accordance with Federal, State, and local requirements.

Conclusions

Although dinoseb was detected (or estimated "J" flag) in soil samples from borings TSB-1 through TSB-5, all reported concentrations were below the EPA Region 6 MSL for subsurface soil. Furthermore, confirmation sampling at TSB-1, which is co-located with historic soil sample 3SB-6, indicates that the

dinoseb concentration of 13,000 mg/kg reported for 3SB-6 (4 – 8 feet) in the FI (EnSafe, 1996), is erroneous. Based on this information, the assessment of dinoseb in soil at Site 3 is complete and all results are below the EPA Region 6 MSL.

Upon approval of this *Wormald Site Investigation Report*, Tyco Safety Products – Ansul Incorporated will prepare a Feasibility Study for submittal to the ADEQ within sixty days. If you have any questions or require additional information, please contact me at 864-234-2282 or Ms. Ann Faitz at (501)831-5637.

Sincerely,

Leslee J. Alexander, P.G.
Project Manager

APPENDIX C
DATA VALIDATION REPORT/CERTIFICATES OF ANALYSIS

DATA VALIDATION REPORT

Data assessment is a systematic process for reviewing a body of data against a predefined set of criteria to provide assurance that the data meet project Data Quality Objective (DQO) requirements. The purpose of the data assessment process is to determine if and how the usability of the analytical data is affected by the overall analytical processes and sample collection and handling procedures. If specific DQOs are not met, the data are qualified (i.e., data flags are assigned to sample results) in accordance with guidelines established by the United States Environmental Protection Agency (USEPA). Data assessment allows the data user to adequately determine if the data can be used for its intended purpose. The data acceptance criteria are established according to Standard Operating Procedures (SOPs) and Statements of Work (SOWs) provided to the contracted analytical laboratory. The assessment of data quality and usability involves five components, as described below.

- 1) **Field Sampling Check** is a process to ensure that all samples were collected and the laboratory analyses were performed as stipulated in the applicable site-specific Work Plan or Field Sampling Plan (FSP). Inspection of sample preservation procedures, sample handling, analysis requested, sample description and ID, cooler receipt forms, holding time evaluation, and Chain of Custody procedures are all evaluated to ensure that the evidentiary nature of the samples and the resulting analytical data have not been compromised.
- 2) **Data Verification** is a process for determining the completeness, correctness, consistency, and compliance of a data package in accordance with requirements contained in the applicable SOW and/or contract-specific requirements. This is a review of the data package, electronic data deliverable (EDD), and invoice received from the contract laboratory to ensure that the contract required information is present and complete prior to data validation.
- 3) **Data Review** is a process of reviewing the primary quality control (QC) data provided by the laboratory and the results of any internal quality assurance (QA)/QC samples, such as field blanks, trip blanks, equipment blanks or ambient blanks, field split samples, and duplicate samples, to ascertain any effect the laboratory's procedures or the sample collection process has on the data.
- 4) **Data Evaluation** is a process to determine if the data meet project-specific DQOs and contract requirements. This evaluation may involve a review of field sampling and sample management procedures, laboratory audits, Performance Evaluation (PE) sample results, and any other data quality indicators that are available.
- 5) **Data Validation** is a process to determine the accuracy and precision of analytical data generated and to identify any anomalies encountered. The validation process is performed in accordance with USEPA regional or national functional guidelines, project-specific guidelines, and compliance with the requirements of each analytical method. Two major components of data

validation are laboratory performance and matrix interferences. Evaluation of laboratory performance is a check for compliance for each analytical method to determine if the samples were analyzed within the prescribed acceptance criteria of the method. Evaluation of matrix interferences involves the analysis of surrogate spike recoveries, matrix spike recoveries, and duplicate sample results. Data not meeting project-specific DQOs or the requirements of the analytical method are qualified with data flags according to referenced guidelines.

Data Assessment Procedures

Earth Tech performed independent QC checks of field and laboratory procedures that were used in collecting and analyzing the data. The QC checks verify that the data collected are of appropriate quality for the intended data use and that the DQOs were met. The steps and guidelines followed during the data validation process were modeled on the *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review* (USEPA, July 2004), *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review* (USEPA, October 1999), and *Data Validation Standard Operating Procedures for Contract Laboratory Program Routine Analytical Services* (USEPA, July 1999). In addition, method-specific criteria set forth in the compendium of analytical methods found in the *Test Methods for Evaluation Solid Waste (SW-846), Update III* (USEPA, June 1997) are also evaluated during the validation process. This validation process has been adapted to meet the DQO requirements for generation of definitive critical data.

Data Validation Results

The analytical data (5 soil samples – TSB-1, TSB-2, TSB-3, TSB-4, and TSB-5 and 1 waste sample – IDW-4) plus QA/QC data (1 field duplicate sample – TSB-1-a, 1 matrix spike sample – TSB-1-ms/matrix spike duplicate sample – TSB-1-msd, and 1 rinsate blank sample – TSB-1-d) were collected on March 5, 2009 for the Former Cedar Chemicals Facility. The analytical data were validated according to the procedures outlined above. Where data flags have been applied to this data set, they are separated by a slash “/” and presented in the following format:

Laboratory Flag / Result Flags / Analysis Flags

- **Laboratory Flag:** This flag precedes the first slash and is added by the laboratory as a result of QC excursions from the analytical method. These flags are laboratory-specific and are described in the associated laboratory report.
- **Result Flags:** These are presented after the first slash and are added by Earth Tech based on data validation procedures and guidelines. They tell how and if the data should be used.
- **Analysis Flags:** These flags are presented after the second slash and are added by Earth Tech to inform the data user of any specific QA/QC problems that were encountered.

Any data requiring qualification as a result of the validation process were assigned data flags, as discussed below. The validation flags indicate how any QC excursions may have impacted the usability of the data.

Dinoseb by Method 8151A

Results of the validation process indicate that the data analyzed for this method are acceptable for their intended use and no data flags are required.

TCLP Volatile Organic Compounds by Method 8260B

Results of the validation process indicate that the data analyzed for this method are acceptable for their intended use and no data flags are required.

TCLP Semivolatile Organic Compounds by Method 8270C

Results of the validation process indicate that the data analyzed for this method are acceptable for their intended use and no data flags are required.

TCLP Pesticides by Method 8081A

Results of the validation process indicate that the data analyzed for this method are acceptable for their intended use and no data flags are required.

TCLP Herbicides by Method 8151A

Results of the validation process indicate that the data analyzed for this method are acceptable for their intended use and no data flags are required.

TCLP Metals by Methods 6010B/7470A

Results of the validation process indicate that the data analyzed for this method are acceptable for their intended use and no data flags are required.

Data Summary and Usability

None of the QC excursions encountered during the validation of this data set resulted in any of the data being rejected. Therefore, the data associated with this laboratory batch should be considered compliant and adequate for its intended use.

Project Description Cedar Chemicals
Site W. Helena, AR
Project Number 104336

Environmental Testing and Consulting, Inc. received 8 sample(s) on 3/5/2009 for the analyses presented in the following report.

The above referenced project has been analyzed per your instructions. The analyses were performed in our laboratory in accordance with Standard Methods, The Solid Waste Manual SW-846, EPA Methods for Chemical Analysis of Water and Wastes and /or 40 CFR part 136. Results are reported wet weight unless otherwise indicated.

The EPA requires that water samples analyzed for pH, dissolved oxygen and total residual chlorine be analyzed in the field. Analyses and results reported which do not indicate "Field" for these parameters were analyzed outside the holding time as specified in Table II of 40 CFR Part 136.3.

The analytical data has been validated using standard quality control measures performed as required by the analytical method. Quality Assurance, instrumentation maintenance and calibration were performed in accordance with guidelines established by the USEPA and NELAP.

The results are shown on the attached analysis sheet(s).

Please do not hesitate to contact me or client services if you have any questions or need additional information.

Sincerely,

Nathan Pera IV
Laboratory Project Manager

Lab Order Number:

CASE NARRATIVE

Date: 03/26/09

ETCAL

Herbicides by Method 8151A

Sample Analysis

Samples were initially analyzed without dilution. The levels of Dinoseb present indicated that a dilution factor of 1:1000 would be required. Both the un-diluted and diluted sample extracts were analyzed in the same analytical batch. The high levels of Dinoseb caused an elevated result for this target analyte in the ending calibration verification standard for the confirmation column.

Data presented consists of preliminary results. All dilutions will be re-analyzed to ensure data within the calibration range. Some sample results are flagged with the data qualifier J, to indicate results between the MDL and MQL. These samples will be analyzed at a lesser dilution factor.

Method Blank

Dinoseb was detected in the method blank at a concentration of 6.90 J ug/kg. This concentration had no impact on the final sample data and will be re-analyzed to confirm this result.

Matrix Spike/Matrix Spike Duplicate

The MS/MSD could not be properly evaluated due to the high level of Dinoseb in the parent sample relative to the spike amount.

Pesticides by Method 8081A

Confirmation Analyses

The following compounds were detected in both the primary and confirmatory analyses, with a relative percent difference of greater than 40%. In all cases the higher of the two detected values were used for reporting purposes.

Methoxychlor 80% RPD
